Pallet Stretch Bands

Pallet stretch bands are designed to be used with polythene pallet covers and polythene sheets where it is not possible to use heat shrink covers. These can also be used to stabilise pallets of stacked boxes, to prevent them from falling off or tipping when moving the pallets around.

The pallet stretch bands are applied to the pallet like huge elastic bands which then cling to the pallet and fix the cover in place. These pallet stretch bands do not have the same elasticity as elastic bands as they are primarily made from polythene, with additives. The bands are made to fit the common pallet size 120x100cm and will stretch, then return to their original size. It is possible to make other sizes of pallet band providing the relevant minimum order quantities are met.

Examples of when you might use a pallet band:

- Any thickness pallet cover being applied then removed on a frequent basis, without the desire to use sticky tapes
- Environments where it is not possible to use heat shrink guns for health and safety purposes
- Covering bulky oddly shaped items such as bulging bulk bags
